IN THE CLAIMS:

--1. (Currently Amended)   An information processing device comprising:

a display means for displaying a window and a setting screen for a predetermined object to be operated on a display screen;

a selecting and adjusting means for selecting any one of a plural number of menu items from said setting screen displayed on said display screen by said display means according to a rotation operation and push operation, and for adjusting a setting condition with regard to said selected menu item according to the rotation operation and the push operation; and

a control means for setting said object to said setting condition adjusted by said selecting and adjusting means,

wherein the window simultaneously includes one of (i) information corresponding to each of the plural number of menu items from said setting screen and (ii) information corresponding to the rotation operation and push operation.--

--2. (Previously Presented)   The information processing device according to claim 1, wherein

said selecting and adjusting means moves a slide bar provided corresponding to said selected menu item according to said rotation operation, and adjusts to the setting condition corresponding to a stop position of said slide bar according to said push operation.--

--3. (Previously Presented)   An information processing device comprising:

a display means for displaying a setting screen for a predetermined object to be operated on a display screen;

a selecting and adjusting means for selecting any one of a plural number of menu items from said setting screen displayed on said display screen by said display means according to a rotation operation and push operation, and for adjusting a setting condition with regard to said selected menu item or items according to the rotation operation and the push operation; and

a control means for setting said object to said setting condition adjusted by said selecting and adjusting means,

wherein said selecting and adjusting means moves a marker display with regard to multiple marker columns provided corresponding to said selected menu item according to said rotation operation and adjusts to said setting condition corresponding to a stop position of said marker display according to said push operation.--

--4. (Currently Amended)   An information processing method comprising the steps of:

displaying a window and a setting screen with regard to a predetermined object to be operated on a display screen;

selecting any one of a plural number of menu items from said setting screen displayed on said display screen at said display step according to a rotation operation and a push operation by predetermined selecting and adjusting means, and adjusting a setting condition to said selected menu item according to said rotation operation and the push operation by said selecting and adjusting means; and

setting said object to said setting condition adjusted by said selecting and adjusting means,

wherein the window <u>simultaneously</u> includes ~~one of~~ (i) information corresponding to each of the plural number of menu items from said setting screen and (ii) information corresponding to the rotation operation and push operation.--

--5. (Previously Presented)   The information processing method according to claim 4, wherein

said selecting and adjusting step moves a slide bar provided corresponding to said selected menu item according to the rotation operation and adjusts to the setting condition corresponding to a stop position of said slide bar according to said push operation.--

--6. (Previously Presently)   An information processing method comprising the steps of:

displaying a setting screen with regard to a predetermined object to be operated on a display screen;

selecting any one of a plural number of menu items from said setting screen displayed on said display screen at said display step according to a rotation operation and a push operation by predetermined selecting and adjusting means, and adjusting a setting condition to said selected menu item according to said rotation operation and the push operation by said selecting and adjusting means; and

setting said object to said setting condition adjusted by said selecting and adjusting means,

wherein said selecting and adjusting step moves a marker display or marker displays with regard to a plural number of marker columns provided corresponding to said selected menu item according to said rotation operation and adjusts to said setting condition corresponding to a stop position of said marker display according to said push operation.--

--7. (Currently Amended) A storage medium having a program stored therein for making an information processing device execute programs, said program comprising the steps of:

displaying a window and a setting screen with regard to a predetermined object to be operated on a display screen;

selecting any one of a plural number of menu items from said setting screen displayed on said display screen at said display step according to a rotation operation and a push operation by predetermined selecting and adjusting means, and adjusting a setting condition with regard to said menu item selected according to said rotation operation and the push operation by said selecting and adjusting means; and

setting said object to said setting condition adjusted at said selecting and adjusting step,

wherein the window simultaneously includes one of (i) information corresponding to each of the plural number of menu items from said setting screen and (ii) information corresponding to the rotation operation and push operation.--

--8. (Previously Presented) The storage medium according to claim 7, wherein

said selecting and adjusting step moves a slide bar provided corresponding to said selected menu item according to said rotation operation and adjusts to said setting condition corresponding to a stop position of said slide bar according to said push operation.--

--9. (Previously Presented) A program storage medium having a program stored therein for making an information processing device execute programs, said program comprising the steps of:

displaying a setting screen with regard to a predetermined object to be operated on a display screen;

selecting any one of a plural number of menu items from said setting screen displayed on said display screen at said display step according to a rotation operation and the a push operation by predetermined selecting and adjusting means, and adjusting a setting condition with regard to said menu item selected according to said rotation operation and the push operation by said selecting and adjusting means; and

setting said object to said setting condition adjusted at said selecting and adjusting step,

wherein said selecting and adjusting step moves a marker display with regard to plural number of marker items provided corresponding to said selected menu item and adjusts to said setting condition corresponding to a stop position of said marker display according to said push operation.--
